① Does adding 2 odd numbers give you an odd or even number? Always?
How about adding 2 even numbers?

② Evaluate: $\left(\frac{2}{3} + \frac{1}{2}\right) - \left|-\frac{5}{6}\right|$

SOLVE ③ $\frac{4}{5}x + 2 = -3$

Look over this equation. What is different about it (than any others we have solved so far)?

$$-2 + 10x = 8x - 1$$

Right! There are variables on both sides of the equation.

Step 1 $\Rightarrow$ Get the variables together. Use GRE.

OR

$$\begin{array}{rcl} -2 + 10x & = & 8x - 1 \\ -10x & -10x & \end{array}$$

$$\begin{array}{rcl} -2 + 10x & = & 8x - 1 \\ -8x & -8x & \end{array}$$

$$\begin{array}{rcl} -2 & = & -2x - 1 \\ +1 & & +1 \end{array}$$

$$\begin{array}{rcl} -2 + 2x & = & -1 \\ +2 & & +2 \end{array}$$

$$\begin{array}{rcl} -1 & = & -2x \\ \hline -2 & & -2 \end{array}$$

$$\frac{1}{2} = x$$

$$\boxed{x = \frac{1}{2}}$$

$$\frac{2x}{2} = \frac{1}{2}$$

$$\boxed{x = \frac{1}{2}}$$

☺ I like this way better.
