

# BE-Geometry

Wednesday 8-24-11

ACT  
PRACTICE  
( $\leq 5$  min)

①  $|8-6| - |6-8| = ?$

②  $(d^{16})^5 = ?$

③  $b = -6 \quad c = 5 \quad t = -2$   
 $(c - b - t)(b + t) = ?$

④  $5(3 + 4x) + 6 - x$

Closed Book Quiz 1 return/review.

# FACTORING POLYNOMIALS

Finding polynomials that multiply to  
(usually lower degree)  
produce the original polynomial  
(product)

---

\* (M) Factories make products

---

(EX)  $4 \cdot 3 = 12$

|                                 |                                 |                                    |
|---------------------------------|---------------------------------|------------------------------------|
| MONOMIAL<br>FACTOR,<br>degree 0 | MONOMIAL<br>FACTOR,<br>degree 0 | = MONOMIAL<br>PRODUCT,<br>degree 0 |
|---------------------------------|---------------------------------|------------------------------------|

---

(EX)  $4x \cdot 3x = 12x^2$

|                                 |                                 |                               |
|---------------------------------|---------------------------------|-------------------------------|
| MONOMIAL<br>FACTOR,<br>degree 1 | MONOMIAL<br>FACTOR,<br>degree 1 | MONOMIAL PRODUCT,<br>degree 2 |
|---------------------------------|---------------------------------|-------------------------------|

---

We will often factor monomials, most of the time we will factor 2, 3, or 4 term polynomials. Monomials  $\Rightarrow$  GCF for variables, PRIME FACTORIZATION IF NEEDED FOR NUMBERS.

Find factors of  $42x^4y^3$

$$x^4 \Rightarrow xxxx$$

$$y^3 \Rightarrow yyy$$

$$\begin{array}{c} 42 \\ / \quad \backslash \\ (2) \quad 21 \\ \quad / \quad \backslash \\ \quad (3) \quad (7) \end{array}$$

FACTORS (use 2, 3, AND 7)  
 $\Rightarrow$  1, 42 must remember

$$2, 3 \cdot 7 = \boxed{2, 21}$$

$$3, 2 \cdot 7 = \boxed{3, 14}$$

$$2 \cdot 3, 7 = \boxed{6, 7}$$

FTOA  $\Rightarrow$  Every number can be written  
 AS A PRODUCT OF PRIMES.  
 FUNDAMENTAL  
 Theorem of ARITHMETIC

ONE (OF MANY) uses  $\Rightarrow$  FINDING ALL PAIRS  
 OF FACTORS OF A NUMBER.

# Factoring Binomials

Methods  $\Rightarrow$  GCF or DOS Pattern  
(difference of squares)

$\uparrow$   
LUCKY IF IT IS A  
DOS. Very common  
on ACTs. A "must  
know" for Algebra

Ex  $5x^2 + 25x \Rightarrow$  GCF

$$\boxed{5x(x + 5)}$$

Ex  $3x^2 + 25y \Rightarrow$  No GCF,  
PRIME POLYNOMIAL  
(No factors other  
than 1 & itself)

Ex  $4x^2 - 1$

$$\boxed{(2x + 1)(2x - 1)}$$

DOS

$$\boxed{a^2 - b^2 = (a + b)(a - b)}$$

Skip Trinomials, look A 4-term poly's

## Factoring 4-term Polynomials

Methods  $\Rightarrow$  GCF or FBG  
 (Factor By Grouping)

(Ex)  $3x^4y^3 + 6x^3y + 12x^2y + 6x^2y^3$

$$\boxed{3x^2y(x^2y^2 + 2x + 4 + 2y^2)} \Rightarrow \text{GCF}$$

(Ex)  $4x^2 - 2x + 6x - 3$

$$(4x^2 - 2x) + (6x - 3)$$

$$2x(2x - 1) + 3(2x - 1)$$

$$\text{GCF} = (2x - 1)$$

$$\text{GCF} = (2x - 1)$$

$$\boxed{(2x - 1)(2x + 3)}$$

$\Rightarrow$  NO GCF,  
 TRY FBG,  
 MAY REORDER  
 IF NEEDED.

NOTE: 2/3 WORKS OR  
 NONE WORK  $\Rightarrow$   
 ONLY REORDER ONCE  
 (NEXT PAGE)

MATHForum.org great site for  
 MATH HELP. Go to "ASK DR. MATH"  
 AND USE THE SEARCH BOX. I went  
 there AND input factor by grouping  
 AND found A VERY GOOD EXPLANATION  
 AND SOME USEFUL TIPS THAT ARE NOT  
 IN THE BOOK AND ARE NEW TO ME:

EX) A 4 term POLYNOMIAL HAS 3  
 possible groups:  $a + b + c + d$

$$\textcircled{1} (a + b) + (c + d)$$

$$\textcircled{2} (a + c) + (b + d)$$

$$\textcircled{3} (a + d) + (b + c)$$

IF FBG WORKS, 2 of these groups will  
 work AND 1 will NOT!

IF FBG DOES NOT WORK, 0 of the  
 groups will work!

The "biggie", factoring trinomials of the second degree in one variable... Why? Because if the  $ax^2 + bx + c$  can be factored we can use the Zero Product Property (ZPP) to solve the Quadratic Equation  $ax^2 + bx + c = 0$ .

"Magic Number Method" (of factoring)  
 $ax^2 + bx + c$

Ex)  $15x^2 - x - 2 \Rightarrow ax^2 + bx + c$

Sum =  $b = -1$

prod =  $ac = -30$   
 $\quad \quad \quad \wedge$   
 $\quad \quad \quad +5 -6$

Find 2 magic numbers whose sum is  $b$  and product is  $ac$

$15x^2 + 5x + -6x - 2$

$(15x^2 + 5x) + (-6x - 2)$

$5x(\underline{3x+1}) + -2(\underline{3x+1})$

$(3x+1)(5x-2)$

$$\textcircled{\text{EX}} \quad x^2 + 2x^2 + 15x - 18$$

$$3x^2 + 15x - 18$$

STANDARD  
FORM  
 $ax^2 + bx + c$

$$3 \underbrace{(x^2 + 5x - 6)}$$

GCF!!!

$$\begin{aligned} \text{sum} &= 5 \\ \text{prod} &= -6 \\ &\quad \swarrow \searrow \\ &\quad -1 \quad +6 \end{aligned}$$

NOTE: 2, 3 will  
NOT WORK.  
WHY?

$$3 [(x^2 - 1x) + (6x - 6)]$$

$$3 [x(\underline{x-1}) + 6(\underline{x-1})]$$

$$\boxed{3 [(x-1)(x+6)]}$$

Completely  
Factored

Homework: Pg 751 # 1, 4, 7, 10, 13, 16, 19,  
22, 25, & 28  
(1<sup>st</sup> column)
